

AEON Bank Mobile Engineer Assessment

First of all, thank you for applying to AEON Bank! Below will be a take home assessment to test your knowledge on code practices, implementation as well as your documentation skills. Feel free to go above and beyond and impress us with things that are not even in the scope as well (no pressure tho!)

The code should be then uploaded to GitHub. Do ensure its public and share the link to us!

Problem Statement

As a banking customer, I would like to have a mobile application that is able to view a list of my latest transactions. The transactions can be from incoming and outgoing transactions (which can vary from transferring out, money coming in from fixed deposits, profits, etc).

The list should contain:

- The transfer details
- The date of transfer
- The amount of transfer

Upon clicking in on one of the list items, they should be able to be navigated to a screen where they can view the transaction details. The details should include a list of referenceId, date, recipient name and transfer amount. Users should be able to share the transfer detail page externally to their choice of medium. Here's a sample response from BE:

```
const response = {
  data: [
    {
      refId: "123ABC",
      transferDate: "2024-10-15T12:34:56Z", // Mock transfer date in UTC
      recipientName: "John Doe",
      transferName: "Salary Payment",
      amount: 1500.00
    },
    {
      refId: "456DEF",
      transferDate: "2024-09-21T09:12:45Z", // Mock transfer date in UTC
      recipientName: "Jane Smith",
      transferName: "Invoice Payment",
      amount: 2300.75
    },
    {
      refId: "789GHI",
      transferDate: "2024-10-05T16:18:30Z", // Mock transfer date in UTC
      recipientName: "Robert Brown",
      transferName: "Refund",
      amount: -500.00 // Negative amount for a refund
    },
    {
      refId: "101JKL",
      transferDate: "2024-08-30T11:47:22Z", // Mock transfer date in UTC
      recipientName: "Emily Davis",
      transferName: "Bonus Payment",
      amount: 1200.00
    }
  ]
}
```

Tech Stack

The mobile app should be implemented in React Native. TypeScript would be a huge plus. Do feel free to use your preferred state management but using Zustand would be a bonus as well.

Documentation

Do include steps to run the mobile app as we would like to see it come to life as well (and admire your creation!)

Plus Points

Clean code practices would be a huge plus point, as well as proper commits on your end to ensure we understand your thought process and order of work.

Happy coding!
